Positron-emission tomography (PET) is a nuclear medicine functional imaging technique that is used to observe metabolic processes in the body as an aid to the diagnosis of disease. The system detects pairs of gamma rays emitted indirectly by a positron-emitting radioligand, most commonly fluorine-18, which is introduced into the body on a biologically active molecule called a radioactive tracer.

Positron emission tomography - Wikipedia

Mainly, the concept of quality control is applying a system of routine technical activities to measure and control activities. In this publication you will find two main tracks of discussion, the quality control procedures in construction field, and
